9.1P: In Person Check-in 3 – Answer Sheet

1. What was the most challenging aspect of the case study tasks? Why?

   The main task themselves were not as challenging since the implementation was already laid out, and there were resources and references to ensure a smooth learning. But using tests appropriately was a bit challenging initially, and UML sequence diagrams are also tedious.

2. What is the most valuable thing you have learned in this unit so far?

   Besides C#, I learned how to appropriately test a class, and also gained a stronger foundation in object oriented programming. More specifically, I learned how to properly encapsulate data since that was a concern for me initially, and also understood the importance of abstracting a program design, both of which should help me in my programming journey.

3. What are some strategies for success you can start or continue using for the remainder of the semester and in future units?

   My strategies haven't failed me so far but I did overlook a due date for an assignment, so I will keep a calendar with all due dates rather than attempting to keep a mental image of them. In terms of programming, attempting to create some passion projects along the way should help me gain more practice and stay on top of the latest technologies.
